Attempt : 1
Total Mark : 40
Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

A shopkeeper is recording the daily sales of an item for N days, where the price of the item remains the same for all days. Write a program to calculate the total sales for each day and save them in a file named sales.txt that can store the data for a maximum of 30 days. Then, read the file and display the total earnings for each day.

Note: Total Earnings for each day = Number of Items sold in that day × Price of the item.

Input Format

The first line of input consists of an integer N, representing the number of days.

The second line of input consists of N space-separated integers representing the

number of items sold each day.

The third line of input consists of an integer M, representing the price of the item that is common for all N days.

Output Format

If the number of days entered exceeds 30 (N > 30), the output prints "Exceeding limit!" and terminates.

Otherwise, the code reads the contents of the file and displays the total earnings for each day on separate lines.

Contents of the file: The total earnings for N days, with each day's earnings appearing on a separate line.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 4
5 10 5 0
20
Output: 100
200
100
0

Answer

```
# You are using Python
N = int(input())

if N > 30:
    print("Exceeding limit!")
else:
    items_sold = list(map(int, input().split()))
    M = int(input())
```

```
# Calculate earnings and write to file
with open("sales.txt", "w") as file:
    for items in items_sold:
        file.write(str(items * M) + "\n")

# Read and display earnings from file
with open("sales.txt", "r") as file:
    print(file.read().strip())
```

Status : Correct ***Marks : 10/10***

2. Problem Statement

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted_names.txt.

Input Format

The input consists of multiple lines, each containing a name represented as a string.

To end the input and proceed with sorting, the user can enter 'q'.

Output Format

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: Alice Smith
John Doe
Emma Johnson
q

Output: Alice Smith
Emma Johnson
John Doe

Answer

```
names = []

while True:
    name = input().strip()
    if name == "q":
        break
    names.append(name)

if len(names) < 3 or len(names) > 20:
    print("Invalid number of names!")
else:
    names.sort()

    with open("sorted_names.txt", "w") as file:
        file.write("\n".join(names) + "\n")

    with open("sorted_names.txt", "r") as file:
        print(file.read().strip())
```

Status : Correct ***Marks : 10/10***

3. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an IllegalArgumentException. If the Mobile Number contains any character other than a digit, raise a NumberFormatException.If the Register Number contains any character other than digits and alphabets, throw a NoSuchElementException.If they are valid, print the message ‘valid’ or else print an Invalid message.

Input Format

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

Output Format

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 19ABC1001
9949596920

Output: Valid

Answer

```
class IllegalArgumentException(Exception):
    pass

class NumberFormatException(Exception):
    pass

class NoSuchElementException(Exception):
    pass

def validate_register_number(register_number):
    if len(register_number) != 9:
        raise IllegalArgumentException("Register Number should have exactly 9 characters.")

    if not (register_number[:2].isdigit() and register_number[2:5].isalpha() and register_number[5:].isdigit()):
        raise IllegalArgumentException("Register Number should have the format: 2
```

```
numbers, 3 characters, and 4 numbers.")

    if not register_number.isalnum():
        raise NoSuchElementException("Register Number should contain only digits
and alphabets.")

def validate_mobile_number(mobile_number):
    if len(mobile_number) != 10:
        raise IllegalArgumentException("Mobile Number should have exactly 10
characters.")

    if not mobile_number.isdigit():
        raise NumberFormatException("Mobile Number should only contain digits.")

try:
    register_number = input().strip()
    mobile_number = input().strip()

    validate_register_number(register_number)
    validate_mobile_number(mobile_number)

    print("Valid")

except (IllegalArgumentException, NumberFormatException,
NoSuchElementException) as e:
    print(f"Invalid with exception message: {e}")
```

Status : Correct **Marks : 10/10**

4. Problem Statement

In the enchanted realm of Academia, you, the Academic Alchemist, are bestowed with a magical quill and a parchment to weave the grades of aspiring students into a tapestry of academic brilliance.

The mission is to craft a Python program that empowers faculty members to enter student grades for any two subjects, stores these magical grades in a mystical file, and then, with a wave of your virtual wand, calculates the GPA to unveil the true essence of academic achievement.

Input Format

The input format is a string representing the student's name, any two subjects, and corresponding grades.

After entering grades, they can type 'done' when prompted for the student's name.

Output Format

The output should display the (average of grades) calculated GPA with a precision of two decimal places.

The magical grades will be saved in a mystical file named "magical_grades.txt".

Refer to the sample output for format specifications.

Sample Test Case

Input: Alice
Math
95
English
88
done

Output: 91.50

Answer

```
# You are using Python
with open("magical_grades.txt", "w") as file:
    while True:
        student_name = input().strip()
        if student_name.lower() == "done":
            break

        subject1 = input().strip()
        grade1 = int(input().strip())
        subject2 = input().strip()
        grade2 = int(input().strip())

        if not (0 <= grade1 <= 100 and 0 <= grade2 <= 100):
```

```
        print("Invalid grades! Grades must be between 0 and 100.")
        continue

    gpa = (grade1 + grade2) / 2

    file.write(f"{student_name}: {subject1}-{grade1}, {subject2}-{grade2}, GPA: {gpa:.2f}\n")

    print(f"{gpa:.2f}")
```

Status : Correct ***Marks : 10/10***
